

DECISION STRESS TESTER

Stop me from making a stupid decision.

The problem: Builders commit resources — time, money, engineering, reputation — on assumptions never pressure-tested. ChatGPT, search, and mentors fail the same way: inconsistent, no enforced skepticism. Self-judgment is weak when you're attached to your own idea.

IT IS	IT IS NOT
Bounded skeptical review system	Chatbot or motivator
Structured workflow + agentic loop	Generic critic or oracle
Assumption discovery engine	Professional advisor
Confidence-calibrated output	Final decision-maker

PIPELINE

01 Raw Input User submits decision candidate	02 Decision Intake Conversational extraction of structured artifact	CRITICAL — blocks weak input before analysis	04 Assumption Discovery MOST IMPORTANT — wrong here = bad everything downstream	05 Evidence Assessment Evaluates quality of supporting reasoning
06 Reality Check Surfaces contradictions and external risks	07 Failure Mode Analysis Ranked risks by likelihood and severity	08 Confidence Calibration Honest score, not validation	09 Next Action One concrete thing before committing resources	10 Review Trace Full audit trail of the run

OUTPUT SPEC

Decision Summary	Extracted structured artifact
Missing Context	Gaps flagged before analysis
Material Assumptions	Assumptions that change the outcome if wrong
Evidence Assessment	Quality of supporting reasoning, rated honestly
Contradictions	Reality checks vs. the stated plan
Ranked Failure Modes	Top risks by likelihood + severity
Confidence Score	Honest — not a number to make you feel good
Next Action	One concrete step before committing

AGENTIC LOOP

Continues	Stops / Escalates
• Decision artifact changes	• Input too incomplete
• Input completeness improves	• Requires professional authority
• Assumption set updates	• User disputes without evidence
• Evidence state shifts	• Review becomes circular
• Risk ranking reorders	• User asks system to own decision
• Confidence level changes	• No further iteration adds value

CORE RULES

No concrete decision artifact → no serious stress test.
Do not create fake confidence from incomplete input, weak assumptions, or noisy critique.
Input Sufficiency Gate is the most important control point — do not bypass it.
A review continues only when it materially improves decision quality.
Assumption Discovery is where bad outputs first enter. Miss it and everything downstream fails.
